

Getting started with the Keyblock

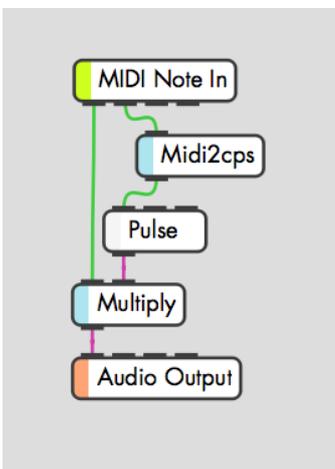

Using the Keyblock to play MIDI notes

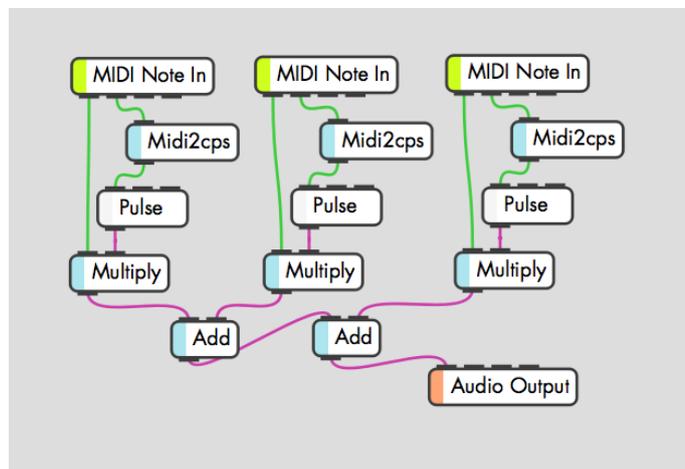

The Keyblock can send MIDI note messages when connected to a Patchblock. These messages can be used to turn a Patchblock into a playable, small keyboard synthesiser. In order to do so, please connect the Keyblock to the Patchblock as shown in the picture below:

In order to receive MIDI messages in the Patchblock you have to create a patch that uses the "MIDI Note In" block. The following pictures show a simple monophonic and polyphonic patch. The Keyblock will send all messages on MIDI channel 1.

Monophonic Synth

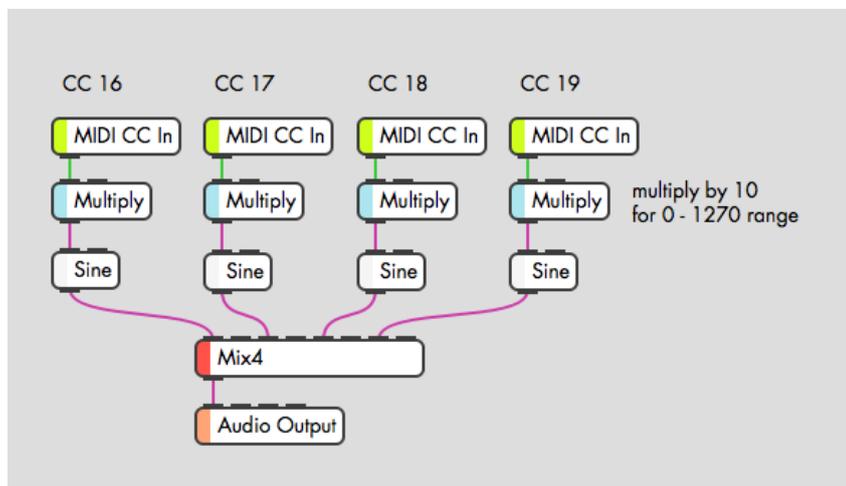

Polyphonic Synth

You can also open "polysynth" from the examples menu in the software for a quick test.

Using the knobs of the Keyblock as continuous controllers

The Keyblock can also send continuous controller messages (CC), giving you additional control of parameters in your patch. In order to receive these messages in your Patchblock, use the 'MIDI CC In' block. Note that the output values from the "MIDI CC In" block range from 0 to 127. If you might want to multiply / divide or map those to another range.

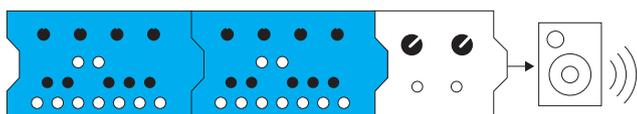

When using one Keyblock, the CC numbers are fixed from 16 (leftmost knob) to 19 (rightmost knob). Again, those messages will be sent on MIDI channel 1.

Receiving CC messages in a patch

Daisy chaining 2 or more Keyblocks

You can connect 2 or more Keyblocks together in order to get additional octaves and more Knobs for CC messages. When you connect another Keyblock to the left, its notes will automatically be shifted down by one octave and the CC numbers shifted down by 4. For example, 2 Keyblocks give you a 2 octave keyboard and CC numbers from 12 to 19.

Combining a Keyblock with a Midiblock

The Keyblock can also be combined with the Midiblock. Any MIDI messages on a channel other than channel 1 will be directly forwarded by the Keyblock. This allows you to receive messages in your Patchblock from your Keyblock and your Midiblock at the same time.

You can also use the combination of Keyblock, Midiblock and Patchblock, to create your own mini-arpeggiator etc. by receiving your Keyblock messages in your Patchblock, then creating arpeggios or different key mappings in your patch and ending those out through a connected Midiblock to the right.

Note, you will always need to attach a Patchblock to the Keyblock, in order to power it. Just a Keyblock and Midiblock combination will not work.
